SAFEST, MOST RELIABLE MARINE HOOKS ARE CRANSTON-EAGLE

It's a sobering fact that often the most dangerous element of deploying a rescue boat or other small craft is the unintentional releasing of the hook while it is still hanging above the water. Delta "T" Systems, and its sister company Delta "P" Subsea Systems, are the exclusive authorized agents for Cranston-Eagle Marine Off-Load Hooks in the Americas. They're among the most trusted and safest in the world for the launch and recovery of rescue boats, and other small craft and equipment.

The off-load design means that Cranston-Eagle hooks will not open when a load is hanging from them. It's only when the weight has been completely taken off, and the release cable pulled, that the locking mechanism will allow the hook to open.

Cranston-Eagle hooks don't have on-load release capability. They'll never accidentally open, potentially causing serious injury or death during rescue boat launch and recovery operations, or drills.

Built from 100% stainless steel, the Cranston-Eagle line has unrivaled strength. Hooks include both cable- and boat-mounted, and lifting capabilities that span from 2.5–12mt. Pull-cable quick release type APR hooks are SOLAS certified and USCG approved. Their robust construction, innovative design and ease of operation make them a

preferred choice for navies, coast guards and workboats, when safety and reliability are required.

Delta "T" Systems and the engineering-based Delta "P" Subsea Systems provide sales, service and parts for Cranston-Eagle Marine Off-Load Hooks. The companies also perform the required five-year load testing and recertification.
