SMARTPLUG INTRODUCES NON-METALLIC INLET

Continuing to improve the reliability and safety of its power products, SmartPlug Systems introduces a Non-Metallic Inlet with a new mounting flange and streamlined cover design. The new look complements the needs of the RV industry. It is offered in 30A/125V and 50A/125/250V models for the US market and in 16A/230V and 32A/230V versions for Europe.

Featuring all of the same high-quality electrical components as the award-winning stainless steel version, this new inlet is easy to use. Double-side locking clips and a sleeved inlet design provide a rock-solid connection. A power indicator lens lets users know when the cordset is providing power. Owners can also upgrade to a Safety Thermostat option, which shuts off power if the inlet becomes overheated. It automatically turns back on once the temperature has cooled down to a safe level.

The non-metallic inlet is available in black, gray and white. It is compatible with the company's other products.

The revolutionary SmartPlug system is designed to replace the traditional and problematic twist-type inlets and connectors. It provides greater protection against loose attachments and corrosion.
